Consulting Engineers

## FOREWORD

The present volume is part of the ***Updated National Water Sector Strategy 2022***, which includes the following volumes:

*The Updated National Water Sector Strategy 2022* (the core volume of the Strategy)

*Annex I : Water Sector Governance*

- A Strategy pillar – SDG 6
- B Current legal and Institutional frameworks
- C Human Resources of the WEs
- D Water tariff analysis
- E Strategic action - Recommendations

*Annex II : Water resources management*

- A Available water resources - Impact pf climate change
- B Surface water resources management
- C Groundwater resources management
- D Guidelines for monitoring water quality
- E Wastewater and sludge management
- F Strategic Environmental and Social Assessment

*Annex III : Water Sector current situation*

- A Tapped water resources and wastewater facilities
- B Demand criteria, assumptions and water balance
- C Appendices to Volume IV

***Annex IV : PROPOSED PROJECTS (this volume)***

- A Criteria for projects and priorities selection
- B Proposed Projects (Bound separately)

*Annex V : DRAWINGS*

## STRUCTURE OF THE PRESENT ANNEX IV

The present volume is divided in two sections:

### Section A : Proposed Projects.

#### A.1 Criteria for projects and priorities selection

Gives a list of the criteria used for the selection of the projects and setting out of the priorities, for water, wastewater, and irrigation projects.

- The criteria used for the selection of the projects and setting out of the priorities.
- A list of the required projects for water, wastewater and irrigation, grouped by WE, and by priority.
- The studies and works for implementing Artificial Aquifers Recharge
- The required studies and works for improving and expanding the Meteorological and Hydrometric networks at the national scale
- The implementation of a PMU
- The implementation the emergency action plan for improving the water governance.
- The required general geological and hydrogeological studies at national scale

#### A.2 Projects' cost estimates

#### A.3 List of Proposed Projects

Gives a list, with cost estimates, of the proposed projects, studies, and investigations, including:

- A list of the required projects for water, wastewater and irrigation, grouped by WE, and by priority.
- The studies and works for implementing Artificial Aquifers Recharge
- The required studies and works for improving and expanding the Meteorological and Hydrometric networks at the national scale
- The implementation of a PMU
- The implementation the emergency action plan for improving the water governance.
- The required general geological and hydrogeological studies at national scale

### Section B : Appendices to Proposed Projects (bound separately)

Provides additional details and justification for each of the proposed projects

## CONTENTS

(Detailed tables of contents are provided at the beginning of each Section)

### Section A

|  |    |
|--|----|
| A.1. Criteria for projects and priorities selection.....         | 8  |
| A.2. Proposed projects cost estimates and ratios per capita..... | 12 |
| A.3. List of proposed projects.....                              | 14 |

### Section B (bound separately)

Appendices to propose projects

## LIST OF ACRONYMS

|                   |  |
|-------------------|--|
| Bm <sup>3</sup>   | Billion cubic meter                          |
| BMLWE             | Beirut and Mount Lebanon Water Establishment |
| BWE               | Bekaa Water Establishment                    |
| CDR               | Council for Development and Reconstruction   |
| CM                | Customer Management                          |
| EIB               | European Investment Bank                     |
| EU                | European Union                               |
| HR                | Human resources                              |
| IFRS              | International Financial Reporting Standards  |
| IWMI              | International Water Management Institute     |
| l/c/d             | Litres per capita per day                    |
| l/sec             | Litres per second                            |
| LBP               | Lebanese Pound                               |
| LRA               | Litani River Authority                       |
| m <sup>3</sup> /d | Cubic meter per day                          |
| m <sup>3</sup> /h | Cubic meter per hour                         |
| masl              | Meters above sea level                       |
| MCM               | Million cubic meter                          |
| MENA              | Middle East and North Africa region          |
| Mm <sup>3</sup>   | Million cubic meter                          |
| MoA               | Ministry of Agriculture                      |
| MoE               | Ministry of Environment                      |
| MoEW              | Ministry of Energy and Water                 |

## A.1. CRITERIA FOR PROJECTS AND PRIORITIES SELECTION

### A.1.1 GENERAL

The NWSS aims to identify the projects that need to be implemented in order to cover the needs of the population in terms of drinking water, wastewater, and water for irrigation. Those needs for the strategy horizon (2035), covering the whole territory, are given in *Volume IV*.

In addition, the Consultants undertook a comprehensive assessment of the statuses and capacities of the existing infrastructures and operational systems, which allowed identifying the gaps that should be filled in order to cover the needs. These gaps were then translated into projects in all three sectors, and prioritized by order of urgency and impact:

- Priority 1 is for urgent projects to be implemented as soon as can be.
- Priority 2 is for projects that are required but could be delayed if no possibility to implement them now.
- Priority 3 is for projects that would be required in the future, based on the foreseen evolution of the present status of the water sector.

### A.1.2 CRITERIA FOR WATER PROJECTS SELECTION

#### A. 1.2.1 Priority 1 (2020 -2025)

Priority 1 is for projects addressing a negative water balance in a given water distribution scheme, and/or implementing missing components such as reservoirs, networks, and pumping stations in order to extend the coverage and the good performance of the distribution scheme. Namely:

- Development and expansion of water resources to cover potable water needs, i.e. in water systems having a negative water balance in 2020
- Provision of adequate water storage capacities, i.e. in water systems that currently have very small reservoirs compared to the required storage or in those that have very old reservoirs that need to be replaced.
- Provision of adequate main transmission lines by constructing new ones, increasing the capacity of existing ones, and replacing very old ones
- Construction of distribution networks, mainly in water systems that currently don't have a distribution network or where the network is very old and in bad condition.
- Monitoring main transmission and distribution lines through the installation of district water meters, in order to better control the distribution and address leakage issues.

#### A. 1.2.2 Priority 2 (2025 - 2030)

Priority 2 projects cover mainly :

- The extension of existing distribution networks and/or replacement of old ones
- The expansion of existing water storage capacities to the required standards

## A.1 Criteria for Projects and priorities selection

- The development of new (or improvement of existing) water resources to address future negative water balances, along with the construction of related works (i.e. transmission lines, pumping stations, reservoirs ...)

**A. 1.2.3 Priority 3**

Priority 3 is for projects that should be implemented to address expected issues at the long term.

**A.1.3 CRITERIA FOR WASTEWATER PROJECTS SELECTION**

The main objective of the proposed wastewater projects is to eradicate, or at least reduce, the nuisance to the environment and to groundwater by minimizing the discharge of untreated wastewater into the open or in waterbodies. For this purpose, priorities are set as follows :

**A. 1.3.1 Priority 1**

- Implement new WWTPs and sewers in densely populated areas with poor (or nonexistent) sanitation infrastructure
- Expansion and upgrade of major existing WWTPs the treatment capacity of which isn't enough to treat the influent (in 2020) to acceptable standards.
- Implementation of new WWTPs and sewers in areas that are in the watershed of proposed and existing dams

**A. 1.3.2 Priority 2**

- Implementation of new WWTPs and sewer networks in less densely populated areas
- Expansion and upgrade of existing WWTPs if their treatment capacity isn't enough to treat the influent wastewater flows in the near future

**A. 1.3.3 Priority 3**

- Implementation of small wastewater treatment units in isolated villages/areas

**A.1.4 CRITERIA FOR IRRIGATION PROJECTS SELECTION**

A negative water balance and/or the bad status and coverage of the irrigation networks. However, proper estimation of the water balance is quite impossible due to the lack of meteorological and hydrometric data, and insufficient studies on the subject. Therefore Priorities are set as follows :

**A. 1.4.1 Priority 1**

For agricultural areas requiring :

- Concreting of existing earth channels
- Rehabilitation of existing concrete channels
- Construction of new irrigation networks (channels or pipes)

#### A. 1.4.2 Priority 2

Increase the availability of water resources and construct all related works (i.e. irrigation transmission and distribution lines and small storage structures)

#### A. 1.4.3 Priority 3

Construction of new networks and development of new resources for potential future expansions

### A.1.5 CRITERIA FOR DAMS AND HILL LAKES SELECTION

The expected impact of climate change (see Volume III, Section III A.2.) is that the volumes of water stored in aquifers and in the form of snow will be reduced in favour of lost runoff to the sea (at least on the western slope of Mount Lebanon, but this is exactly where the majority of the population lives). This reduction in the volumes stored naturally must be compensated artificially through artificial aquifers recharge where possible and/or through the construction of retention dams.

It is a strategic option to keep groundwater resources as a strategic reserve for the future and use them only in areas where surface storage is not possible or insufficient to cover the growing needs.

Therefore surface storage must be a strategic priority. The NWSS 2020 considers the construction of surface storage facilities as the first resort to compensate for water supply needs, provided it is financially, technically and environmentally feasible.

It should be noted that some of the dams identified in the 2011 strategy are now dismissed due to the following:

- Different criteria used to calculate the water demands leading to acceptable water balances.
- Feasibility or Design studies conducted on some dams has shown that they are geotechnically not feasible
- The sites selected for dam construction are now constructed and not available anymore

The main objective of the proposed dams and Hill lakes is to secure new water resources to cover future potable water and/or irrigation needs in areas with high negative water balance where no other resources are available. Priorities are set depending on when the storage would be needed.

#### A. 1.5.1 Priority 1

For Dams that would be needed in the next ten years, the construction of which should therefore start as soon as possible.

For Hill Lakes in areas facing severe water shortages for irrigation purposes, or in areas that have witnessed a drastic and rapid increase in irrigated lands in the past few years

### A. 1.5.2 Priority 2

For Dams that would be needed in more than 15 years, the construction of which should therefore start in less than 10 years.

For Hill Lakes in areas facing less severe water shortages for irrigation purposes, or in areas that witness a relatively stable or slight increase in irrigated area

### A. 1.5.3 Priority 3

For Dams that would be needed in more than 20 years, the construction of which should therefore start in less than 15 years.

For Hill Lakes in areas that currently don't face water shortages, but that might require additional resources in the future

A.2 Proposed projects cost estimates and ratios per capita

## A.2. PROPOSED PROJECTS COST ESTIMATES AND RATIOS PER CAPITA

Table A 1 Projects Cost Estimates and ratios per capita

| Project   | Cost<br>M USD | Population<br>capita | Ratio<br>USD / cap   |
|---|---------------|----------------------|----------------------|
| <b><u>NORTH LEBANON WATER ESTABLISHMENT</u></b> |               |                      |                      |
| <b>Drinking water projects</b>                  |               |                      |                      |
| NL-W A. District of Batroun                     | 23.72         | 93 578               | 254                  |

## A.3. LIST OF PROPOSED PROJECTS

The tables hereinafter give a list of the proposed projects, starting with two Tables of Contents, sorted by Water Establishment and by Water Sector.

Each project is given a code number. The same code is given to the corresponding project's appendix in Section B, where additional details and justifications about the project can be found.

**LIST OF PROJECTS**

Sorted by Water Establishment
